Current Proposals for a Balanced Budget Amendment Are More Extreme and Dangerous Than Earlier Versions
July 12, 2011

The balanced budget amendment proposals in the 112th Congress are more radical than earlier proposals. They include caps on federal spending that would force drastic cuts in programs vital to women and families, but do nothing to restrain tax breaks for corporations and wealthy individuals. Moreover, some proposals would tilt the scales even more towards program cuts by requiring supermajorities in both the House and Senate to raise taxes in any way – making tax breaks for the rich and corporate special interests virtually untouchable.

What’s different about the balanced budget amendment proposals in the 112th Congress?

- New proposals would write a cap on federal spending into the Constitution, crippling the government’s ability to meet its obligations and respond to recessions. The McConnell amendment (S.J. Res. 23) would limit annual spending to 18 percent of the prior year’s gross domestic product (GDP) – equal to about 16.7 percent of the current year’s GDP, as GDP typically grows each year. Federal spending has not been that low since 1956, before Medicare or Medicaid even existed. The Goodlatte amendment (H.J. Res. 1, as approved by the House Committee on the Judiciary) similarly would limit spending to “18 percent of economic output,” while the Shelby-Udall (CO) amendment (S.J. Res. 4) would impose a slightly higher, but still unreasonable, cap of 20 percent of the prior year’s GDP.

By contrast, federal spending averaged 22 percent of GDP during Ronald Reagan’s presidency – before the baby boomers had reached retirement age, swelling the population eligible for Social Security and Medicare, and when health care costs were much lower. Capping future spending below Reagan-era levels would force sweeping cuts to Medicaid, Medicare, Social Security, child care, education, and many other critical programs. And a spending cap would limit the government’s ability to spend even if spending and revenues were in balance.

It would take a supermajority of all members in both houses (two-thirds under McConnell and Goodlatte, three-fifths under Shelby-Udall) to approve spending above the cap in any fiscal year. This would prevent the government from responding quickly and effectively to new demands or economic downturns.

In contrast, while the leading balanced budget amendment proposals in the 1990s generally required a three-fifths vote of all members to approve spending in excess of revenues, they did not impose a separate cap on spending.

- Some proposals would write a requirement of a supermajority vote to raise revenue into the Constitution. Both the McConnell amendment and the Goodlatte amendment (as approved by the House Committee on the Judiciary) would require a two-thirds vote in both houses to raise revenue.
In contrast, while the leading balanced budget amendment proposals in the 1990s generally required that a majority of members in both houses approve any increase in taxes, they did not require a supermajority to raise revenue.

Why shouldn’t the federal government have to balance its budget like states and families do?

- Unlike states and families, the federal government would be prevented from borrowing for important investments and saving for the future. Although states typically are required by their own constitutions to balance their operating budgets, they can borrow money for their capital budgets to fund projects like roads and schools. A state can also build up reserves in years when more revenue flows to its treasury and draw down those reserves in tougher economic times.10 Likewise, a family can borrow money for important investments (e.g., a mortgage to buy a home, a loan to pay for college), and can build savings to draw upon later.

However, under the proposed balanced budget amendments, the total federal budget (including capital investments) would have to be balanced every year, with no borrowing even for investments that yield a future return. If the federal government ran a surplus one year, it would not be able to use those funds next year to help balance the budget.11

- States and families rely on the federal government’s ability to run deficits, especially during economic downturns or national emergencies. When the economy is weak, needs increase while revenues drop, squeezing family and state budgets. The expansion of federal programs such as extended unemployment benefits, Medicaid, and SNAP (formerly Food Stamps) helps struggling families, relieves pressure on state budgets, and boosts demand, helping the economy recover. Similarly, the federal government’s ability to respond quickly to natural disasters and national emergencies can alleviate suffering and prevent further harm.

The U.S. needs responsible, sustainable fiscal policies; deficits cannot grow faster than the economy indefinitely. But a constitutional amendment requiring a balanced budget, especially one with a spending cap or additional barriers to raising revenue, would do more harm than good.

---

4. “Economic output” is not defined in H.J. Res. 1 or the committee report, but it presumably refers to GDP. See H.R. Rep. 112-117, at 25, 35 (2011) (reflecting assumptions by Congressional Budget Office and minority Committee members that economic output is GDP).
7. In contrast, a majority of members present and voting generally is sufficient to pass legislation in the House (and in the Senate, although 60 votes in the Senate are needed to overcome a filibuster).
9. As introduced, H.J. Res. 1 required a three-fifths vote in both houses to raise revenue. An amendment adopted by the House Committee on the Judiciary on June 3 increased the supermajority required to raise revenue to two-thirds.
